Calculating forces between magnets	2	1
Functions for calculating forces and stiffnesses	12	5
Test files	19	12

1. About this file. This is a ‘literate programming’ approach to writing Matlab code using MATLABWEB¹. To be honest I don’t know if it’s any better than simply using the Matlab programming language directly. The big advantage for me is that you have access to the entire L^AT_EX document environment, which gives you access to vastly better tools for cross-referencing, maths typesetting, structured formatting, bibliography generation, and so on.

The downside is obviously that you miss out on Matlab’s IDE with its integrated M-Lint program, debugger, profiler, and so on. Depending on ones work habits, this may be more or less of limiting factor to using ‘literate programming’ in this way.

2. Calculating forces between magnets. This is the source to some code to calculate the forces (and perhaps torques) between two cuboid-shaped magnets with arbitrary displacement and magnetisation direction.

If this code works then I’ll look at calculating the forces for magnets with rotation as well.

```

< magnetforces.m 2 > ≡
[forces torques] =
    function magnetforces(magnet_fixed, magnet_float, magnet_disp);
    < Matlab help text 18 >
    < Extract input variables 3 >
    < Decompose orthogonal superpositions 4 >
    < Transform coordinate systems and calculate force components 5 >
    < Recombine results 11 >
end
    < Functions for calculating forces and stiffnesses 12 >

```

¹<http://tug.ctan.org/pkg/matlabweb>

3. First of all, address the data structures required for the input and output. Because displacement of a single magnet has three components, plus sizes of the faces another three, plus magnetisation strength and direction (two) makes nine in total, we use one of Matlab's structures to pass the information into the function. Otherwise we'd have an overwhelming number of input arguments.

We use spherical coordinates to represent magnetisation angle, where θ is the angle from the vertical ($0 \leq \theta \leq \pi$) and ϕ is the angle around the horizontal plane ($0 \leq \phi \leq 2\pi$).

```

⟨ Extract input variables 3 ⟩ ≡
    a1 = 0.5*magnet_fixed.dim(1);
    b1 = 0.5*magnet_fixed.dim(2);
    c1 = 0.5*magnet_fixed.dim(3);
    a2 = 0.5*magnet_float.dim(1);
    b2 = 0.5*magnet_float.dim(2);
    c2 = 0.5*magnet_float.dim(3);
    J1r = magnet_fixed.magn;
    J2r = magnet_float.magn;
    J1t = magnet_fixed.magdir(1);
    J2t = magnet_float.magdir(1);
    J1p = magnet_fixed.magdir(2);
    J2p = magnet_float.magdir(2);
    dx = magnet_disp(1);
    dy = magnet_disp(2);
    dz = magnet_disp(3);

```

This code is used in section 2.

4. Superposition is used to turn an arbitrary magnetisation angle into a set of orthogonal magnetisations.

Each magnet can potentially have three components, which can result in up to nine force calculations for a single magnet.

```

⟨ Decompose orthogonal superpositions 4 ⟩ ≡
    [J1x J1y J1z] = sph2cart(J1t, J1p, J1r);
    [J2x J2y J2z] = sph2cart(J2t, J2p, J2r);

```

This code is used in section 2.

5. The expressions we have to calculate the forces assume a fixed magnet with positive z magnetisation only. Secondly, magnetisation direction of the floating magnet may only be in the positive z - or y -directions.

The parallel forces are more easily visualised; if $J1z$ is negative, then transform the coordinate system so that up is down and down is up. Then proceed as usual and reverse the vertical forces in the last step.

The orthogonal forces require reflection and/or rotation to get the displacements in a form suitable for calculation.

```

⟨ Transform coordinate systems and calculate force components 5 ⟩ ≡
  ⟨ Precompute rotation matrices 17 ⟩
  force_components_x = zeros(3);
  force_components_y = zeros(3);
  force_components_z = zeros(3);
  ⟨ Calculate parallel forces 6 ⟩
  ⟨ Calculate orthogonal forces 7 ⟩

```

This code is used in section 2.

6. The parallel forces are easier, so I'll do them first.

```

⟨ Calculate parallel forces 6 ⟩ ≡
  if ¬ ( J1x ≡ 0 ∨ ∨ J2x ≡ 0 )
    ⟨ Calculate forces x-x 9 ⟩
  end
  if ¬ ( J1y ≡ 0 ∨ ∨ J2y ≡ 0 )
    ⟨ Calculate forces y-y 10 ⟩
  end
  if ¬ ( J1z ≡ 0 ∨ ∨ J2z ≡ 0 )
    ⟨ Calculate forces z-z 8 ⟩
  end

```

This code is used in section 5.

7. It becomes much hard to visualise how the coordinates should be transformed for the orthogonal magnetisations.

```

⟨ Calculate orthogonal forces 7 ⟩ ≡

```

This code is used in section 5.

8. The easy one. Note that $J1z$ and $J2z$ can be negative and the forces calculated will be correct.

```

⟨ Calculate forces z-z 8 ⟩ ≡
  [Fx Fy Fz] = forces_parallel(a1, b1, c1, a2, b2, c2, dx, dy, dz, J1z, J2z);
  force_components(3, 3, :) = [Fx Fy Fz];

```

This code is used in section 6.

9. Rotate the entire coordinate system around the y -axis so that the new z is the old x . After the forces are calculated, rotate them back to the original coordinate system.

```

⟨ Calculate forces  $x$ - $x$  9 ⟩ ≡
    [dxr dyr dzr] = rotate_x_to_z([dx dy dz]);
    [Fx Fy Fz] = forces_parallel(c1, b1, a1, c2, b2, a2, dxr, dyr, dzr, J1x, J2x);
    force_components(1, 1, :) = rotate_z_to_x([Fx Fy Fz]);

```

This code is used in section 6.

10. Rotate again, this time making x the ‘up’ direction.

```

⟨ Calculate forces  $y$ - $y$  10 ⟩ ≡
    [dxr dyr dzr] = rotate_y_to_z([dx dy dz]);
    [Fx Fy Fz] = forces_parallel(a1, c1, b1, a2, c2, b2, dxr, dyr, dzr, J1y, J2y);
    force_components(2, 2, :) = rotate_z_to_y([Fx Fy Fz]);

```

This code is used in section 6.

11. Next

```

⟨ Recombine results 11 ⟩ ≡

```

This code is used in section 2.

12. Functions for calculating forces and stiffnesses. The calculations for forces between differently-oriented cuboid magnets are all directly from the literature. The stiffnesses have been derived by differentiating the force expressions, but that's the easy part.

\langle Functions for calculating forces and stiffnesses [12](#) $\rangle \equiv$
 \langle Parallel magnets force calculation [13](#) \rangle
 \langle Parallel magnets stiffness calculation [14](#) \rangle
 \langle Orthogonal magnets force calculation [15](#) \rangle
 \langle Orthogonal magnets stiffness calculation [16](#) \rangle

This code is used in section [2](#).

13. The expressions here follow directly from Akoun and Yonnet [1].

Inputs:	(a, b, c)	the half dimensions of the fixed magnet
	(A, B, C)	the half dimensions of the floating magnet
	(dx, dy, dz)	distance between magnet centres
	$(J, J2)$	magnetisations of the magnet(s) in the z-direction
Outputs:	(Fx, Fy, Fz)	Forces of the second magnet

```

⟨Parallel magnets force calculation 13⟩ ≡
function [Fx Fy Fz]=forces_parallel(a, b, c, A, B, C, dx, dy, dz, J, J2)
    % You probably want to call
    % warning off MATLAB:divideByZero
    % warning off MATLAB:log:logOfZero

    if nargin < 11
        J2 = J;
    elseif nargin < 10
        error('Wrong number of input arguments.')
    end

    [index_h, index_j, index_k, index_l, index_p, index_q] = ndgrid([0 1]);
    index_sum = (-1) .^ (index_h + index_j + index_k + index_l + index_p +
        index_q);
    % (Using this method is actually LESS efficient than using six for
    % loops for h..q over [0 1], but it looks a bit nicer, huh?)

    u = dx + A*(-1) .^ index_j - a*(-1) .^ index_h;
    v = dy + B*(-1) .^ index_l - b*(-1) .^ index_k;
    w = dz + C*(-1) .^ index_q - c*(-1) .^ index_p;
    r = sqrt(u.^2 + v.^2 + w.^2);

    f_x = ...
    +0.5*(v.^2 - w.^2).*log(r-u)...
    +u.*v.*log(r-v)...
    +v.*w.*atan(u.*v./r./w)...
    +0.5*r.*u;

    f_y = ...
    +0.5*(u.^2 - w.^2).*log(r-v)...
    +u.*v.*log(r-u)...
    +u.*w.*atan(u.*v./r./w)...
    +0.5*r.*v;

    f_z = ...
    -u.*w.*log(r-u)...
    -v.*w.*log(r-v)...
    +u.*v.*atan(u.*v./r./w)...
    -r.*w;

```

```

fx = index_sum .* f_x;
fy = index_sum .* f_y;
fz = index_sum .* f_z;
magconst = J*J2/(4*pi*(4*pi*1 · 10-7));
Fx = magconst*sum(fx(:));
Fy = magconst*sum(fy(:));
Fz = magconst*sum(fz(:));
end

```

This code is used in section 12.

14. And these are the stiffnesses.

Inputs:	(a, b, c)	the half dimensions of the fixed magnet
	(A, B, C)	the half dimensions of the floating magnet
	(dx, dy, dz)	distance between magnet centres
	$(J, J2)$	magnetisations of the magnet(s) in the z-direction
Outputs:	(Kx, Ky, Kz)	Stiffnesses of the 2nd magnet

⟨ Parallel magnets stiffness calculation 14 ⟩ \equiv

```

function [Kx Ky Kz] = stiffness_parallel(a, b, c, A, B, C, dx, dy, dz, J, J2)
    % You probably want to call
    % warning off MATLAB:divideByZero
    % warning off MATLAB:log:logOfZero

    if nargin < 11
        J2 = J;
    elseif nargin < 10
        error('Wrong number of input arguments.')
    end

    [index_h, index_j, index_k, index_l, index_p, index_q] = ndgrid([0 1]);
    index_sum = (-1) .^ (index_h + index_j + index_k + index_l + index_p +
        index_q);

    % Using this method is actually less efficient than using six for
    % loops for h..q over [0 1]. To be addressed.

    u = dx + A*(-1) .^ index_j - a*(-1) .^ index_h;
    v = dy + B*(-1) .^ index_l - b*(-1) .^ index_k;
    w = dz + C*(-1) .^ index_q - c*(-1) .^ index_p;
    r = sqrt(u.^2 + v.^2 + w.^2);
    k_x = ...
        -r ...
        -(u.^2.*v) ./ (u.^2 + w.^2) ...
        -v .* log(r - v);
    k_y = ...
        -r ...
        -(v.^2.*u) ./ (v.^2 + w.^2) ...
        -u .* log(r - u);
    k_z = -k_x - k_y;
    kx = index_sum .* k_x;
    ky = index_sum .* k_y;
    kz = index_sum .* k_z;

    magconst = J*J2/(4*pi*(4*pi*1e-7));
    Kx = magconst*sum(kx(:));
    Ky = magconst*sum(ky(:));
    Kz = magconst*sum(kz(:));

```

end

This code is used in section 12.

15. Orthogonal magnets forces given by Yonnet and Allag [2]. The magnetisation of the floating magnet $J2$ is in the positive y -direction.

⟨ Orthogonal magnets force calculation 15 ⟩ \equiv

```

function [Fx Fy Fz] = forces_orthogonal(a, b, c, A, B, C, dx, dy, dz, J, J2)
    if nargin < 11
        J2 = J;
    elseif nargin < 10
        error('Wrong number of input arguments. ')
    end

    [index_h, index_j, index_k, index_l, index_p, index_q] = ndgrid([0 1]);
    index_sum = (-1) .^ (index_h + index_j + index_k + index_l + index_p +
        index_q);
    % (Using this method is actually LESS efficient than using six for
    % loops for h..q over [0 1], but it looks a bit nicer, huh?)

    u = dx + A*(-1) .^ index_j - a*(-1) .^ index_h;
    v = dy + B*(-1) .^ index_l - b*(-1) .^ index_k;
    w = dz + C*(-1) .^ index_q - c*(-1) .^ index_p;
    r = sqrt(u.^2 + v.^2 + w.^2);

    fx = ...
        -v.*w.*ln(r-u)...
        +v.*u.*ln(r+w)...
        +w.*u.*ln(r+v)...
        -0.5*u.^2.*arctan(v.*w./(u.*r))...
        -0.5*v.^2.*arctan(u.*w./(v.*r))...
        -0.5*w.^2.*arctan(u.*v./(w.*r));

    fy = ...
        0.5*(u.^2 - v.^2).*ln(r+w)...
        -u.*w.*ln(r-u)...
        -u.*v.*arctan(u.*w./(v.*r))...
        -0.5*w.*r;

    fz = ...
        0.5*(u.^2 - w.^2).*ln(r+v)...
        -u.*v.*ln(r-u)...
        -u.*w.*arctan(u.*v./(w.*r))...
        -0.5*v.*r;

    fx = index_sum.*fx;
    fy = index_sum.*fy;
    fz = index_sum.*fz;

    magconst = J*J2/(4*pi*(4*pi*1e-7));
    Fx = magconst*sum(fx(:));
    Fy = magconst*sum(fy(:));
    Fz = magconst*sum(fz(:));

```

This code is used in section 12.

16. Orthogonal magnets stiffnesses.

⟨ Orthogonal magnets stiffness calculation 16 ⟩ ≡
 % not yet calculated

This code is used in section 12.

17. When the forces are rotated we use these rotation matrices to avoid having to think too hard.

⟨ Precompute rotation matrices 17 ⟩ ≡
 Rx = @(theta) [1 0 0; 0 cos(theta) - sin(theta); 0 sin(theta) cos(theta)];
 Ry = @(theta) [cos(theta) 0 sin(theta); 0 1 0; -sin(theta) 0 cos(theta)];
 Rz = @(theta) [cos(theta) - sin(theta) 0; sin(theta) cos(theta) 0; 0 0 1];
 rotate_z_to_x = @(vec) Ry(pi/2)*vec'
 rotate_x_to_z = @(vec) Ry(-pi/2)*vec'
 rotate_z_to_y = @(vec) Rx(-pi/2)*vec'
 rotate_y_to_z = @(vec) Rx(pi/2)*vec'

This code is used in section 5.

18. When users type `help magnetforces` this is what they see. This is designed to be displayed in a fixed-width font so the output here will be fairly ugly.

⟨ Matlab help text 18 ⟩ ≡
 %% MAGNETFORCES Calculate forces between two cuboid magnets
 %
 % Finish this off later.
 %

This code is used in section 2.

19. Test files. The chunks that follow are designed to be saved into individual files and executed automatically to check for (a) correctness and (b) regression problems as the code evolves.

How do I know if the code produces the correct forces? Well, for many cases I can compare with published values in the literature. Beyond that, I'll be setting up some tests that I can logically infer should produce the same results (such as mirror-image displacements) and test that.

There are many Matlab unit test frameworks but I'll be using a fairly low-tech method. In time this test suite should be (somehow) useable for all implementations of `magnetocode`, not just Matlab.

```
<magforce-test001a.m 19> ≡
    magnet_fixed.dim = [0.02 0.04 0.06];
    magnet_fixed.magn = 1.3;
    magnet_fixed.madir = [0 0];      % vertical
    magnet_float.dim = [0.07 0.05 0.03];
    magnet_float.magn = 1.1;
    magnet_float.madir = [0 0];      % vertical
    magnet_disp = [0.1 0.15 0.05];
```
