Calculating forces between magnets	2	1
Functions for calculating forces and stiffnesses	12	5
Test files	19	12

1. About this file. This is a 'literate programming' approach to writing Matlab code using Matlaburella To be honest I don't know if it's any better than simply using the Matlab programming language directly. The big advantage for me is that you have access to the entire IATEX document environment, which gives you access to vastly better tools for cross-referencing, maths typesetting, structured formatting, bibliography generation, and so on.

The downside is obviously that you miss out on Matlab's IDE with its integrated M-Lint program, debugger, profiler, and so on. Depending on ones work habits, this may be more or less of limiting factor to using 'literate programming' in this way.

2. Calculating forces between magnets. This is the source to some code to calculate the forces (and perhaps torques) between two cuboid-shaped magnets with arbitary displacement and magnetisation direction.

If this code works then I'll look at calculating the forces for magnets with rotation as well.

```
⟨magnetforces.m 2⟩ ≡
    [forces torques] =
        function magnetforces(magnet_fixed, magnet_float, magnet_disp);
    ⟨Matlab help text 18⟩
    ⟨Extract input variables 3⟩
    ⟨Decompose orthogonal superpositions 4⟩
    ⟨Transform coordinate systems and calculate force components 5⟩
    ⟨Recombine results 11⟩
    end
    ⟨Functions for calculating forces and stiffnesses 12⟩
```

¹http://tug.ctan.org/pkg/matlabweb

3. First of all, address the data structures required for the input and output. Because displacement of a single magnet has three components, plus sizes of the faces another three, plus magnetisation strength and direction (two) makes nine in total, we use one of Matlab's structures to pass the information into the function. Otherwise we'd have an overwhelming number of input arguments.

We use spherical coordinates to represent magnetisation angle, where θ is the angle from the vertical $(0 \le \theta \le \pi)$ and phi is the angle around the horizontal plane $(0 \le \phi \le 2\pi)$.

```
\langle \text{Extract input variables } 3 \rangle \equiv
  a_1 = 0.5*magnet\_fixed.dim(1);
  b_1 = 0.5*magnet\_fixed.dim(2);
  c_1 = 0.5*magnet\_fixed.dim(3);
  a_2 = 0.5*magnet\_float.dim(1);
  b_2 = 0.5*magnet\_float.dim(2);
  c_2 = 0.5*magnet\_float.dim(3);
  J1r = magnet\_fixed.magn;
  J2r = magnet\_float.magn;
  J1t = magnet\_fixed.magdir(1);
  J2t = magnet\_float.magdir(1);
  J1p = magnet\_fixed.magdir(2);
  J2p = magnet\_float.magdir(2);
  dx = magnet\_disp(1);
  dy = magnet\_disp(2);
  dz = magnet\_disp(3);
This code is used in section 2.
```

4. Superposition is used to turn an arbitrary magnetisation angle into a set of orthogonal magnetisations.

Each magnet can potentially have three components, which can result in up to nine force calculations for a single magnet.

```
\langle Decompose orthogonal superpositions 4\rangle \equiv [J1x J1y J1z] = sph2cart(J1t, J1p, J1r); [J2x J2y J2z] = sph2cart(J2t, J2p, J2r);
```

5. The expressions we have to calculate the forces assume a fixed magnet with positive z magnetisation only. Secondly, magnetisation direction of the floating magnet may only be in the positive z- or y-directions.

The parallel forces are more easily visualised; if J1z is negative, then transform the coordinate system so that up is down and down is up. Then proceed as usual and reverse the vertical forces in the last step.

The orthogonal forces require reflection and/or rotation to get the displacements in a form suitable for calculation.

 $\langle \text{Transform coordinate systems and calculate force components} \quad 5 \rangle \equiv \\ \langle \text{Precompute rotation matrices} \quad 17 \rangle \\ \text{force_components_x} = \text{zeros}(3); \\ \text{force_components_y} = \text{zeros}(3); \\ \text{force_components_z} = \text{zeros}(3); \\ \langle \text{Calculate parallel forces} \quad 6 \rangle \\ \langle \text{Calculate orthogonal forces} \quad 7 \rangle$

This code is used in section 2.

6. The parallel forces are easier, so I'll do them first.

```
\langle Calculate parallel forces \  \, 6 \rangle \equiv \  \,  if NOT ( J1x \equiv 0 OR J2x \equiv 0 ) \langle Calculate forces x-x \  \, 9 \rangle  end if NOT ( J1y \equiv 0 OR J2y \equiv 0 ) \langle Calculate forces y-y \  \, 10 \rangle  end if NOT ( J1z \equiv 0 OR J2z \equiv 0 ) \langle Calculate forces z-z \  \, 8 \rangle  end
```

This code is used in section 5.

7. It becomes much hard to visualise how the coordinates should be transformed for the orthogonal magnetisations.

```
\langle Calculate orthogonal forces \rangle \equiv
```

This code is used in section 5.

8. The easy one. Note that J1z and J2z can be negative and the forces calculated will be correct.

```
\langle \text{Calculate forces } z\text{-}z \mid 8 \rangle \equiv
[Fx \ Fy \ Fz] = forces\_parallel(a_1, b_1, c_1, a_2, b_2, c_2, dx, dy, dz, J1z, J2z);
force\_components(3, 3, :) = [Fx \ Fy \ Fz];
```

9. Rotate the entire coordinate system around the y-axis so that the new z is the old x. After the forces are calculated, rotate them back to the original coordinate system.

```
 \begin{split} \langle \, \text{Calculate forces} \, \, x\text{-}x & \; \; 9 \, \rangle \equiv \\ [\, dxr \, \, dyr \, \, dzr \,] = rotate\_x\_to\_z([\, dx \, \, dy \, \, dz \,]); \\ [\, Fx \, \, Fy \, \, Fz \,] = forces\_parallel(c_1, \, b_1, \, a_1, \, c_2, \, b_2, \, a_2, \, dxr, \, dyr, \, dzr, \, J1x, \, J2x); \\ force\_components(1, \, 1, \, :) = rotate\_z\_to\_x([\, Fx \, \, Fy \, \, Fz \,]); \end{split}
```

This code is used in section 6.

10. Rotate again, this time making x the 'up' direction.

```
\langle \text{Calculate forces } y\text{-}y \mid 10 \rangle \equiv
[dxr \ dyr \ dzr] = rotate\_y\_to\_z([dx \ dy \ dz]);
[Fx \ Fy \ Fz] = forces\_parallel(a_1, c_1, b_1, a_2, c_2, b_2, dxr, dyr, dzr, J1y, J2y);
force\_components(2, 2, :) = rotate\_z\_to\_y([Fx \ Fy \ Fz]);
```

This code is used in section 6.

11. Next

 \langle Recombine results $|11\rangle \equiv$

12. Functions for calculating forces and stiffnesses. The calculations for forces between differently-oriented cuboid magnets are all directly from the literature. The stiffnesses have been derived by differentiating the force expressions, but that's the easy part.

```
\begin{split} &\langle\, \text{Functions for calculating forces and stiffnesses} \quad \textcolor{red}{12}\,\rangle \equiv \\ &\langle\, \text{Parallel magnets force calculation} \quad \textcolor{red}{13}\,\rangle \\ &\langle\, \text{Parallel magnets stiffness calculation} \quad \textcolor{red}{14}\,\rangle \\ &\langle\, \text{Orthogonal magnets force calculation} \quad \textcolor{red}{15}\,\rangle \\ &\langle\, \text{Orthogonal magnets stiffness calculation} \quad \textcolor{red}{16}\,\rangle \end{split}
```

13. The expressions here follow directly from Akoun and Yonnet [1].

```
Inputs:
                                  (a, b, c)
                                                                             the half dimensions of the fixed magnet
                                  (A, B, C)
                                                                             the half dimensions of the floating magnet
                                  (dx, dy, dz)
                                                                             distance between magnet centres
                                  (J, J2)
                                                                             magnetisations of the magnet(s) in the z-direction
  Outputs:
                                  (Fx, Fy, Fz)
                                                                            Forces of the second magnet
\langle Parallel magnets force calculation |13\rangle \equiv
     function [Fx Fy Fz] = forces_parallel(a, b, c, A, B, C, dx, dy, dz, J, J2)
                        % You probably want to call
                        % warning off MATLAB:divideByZero
                       \% warning off MATLAB:log:logOfZero
           if nargin < 11
                 J2 = J;
           elseif nargin < 10
                 error('Wrong | number | of | input | arguments.')
           [index_h, index_j, index_k, index_l, index_p, index_q] = ndgrid([0\ 1]);
           index\_sum = (-1).^ (index\_h + index\_j + index\_k + index\_l + index\_p + index\_k + index\_l + index\_l + index\_p + index\_l + in
                       index_q);
                        % (Using this method is actually LESS efficient than using six for
                        % loops for h..q over [0 1], but it looks a bit nicer, huh?)
           u = dx + A*(-1) îndex_j - a*(-1) îndex_h;
           v = dy + B*(-1) . index_l - b*(-1) . index_k;
           w = dz + C*(-1) îndex_q - c*(-1) îndex_p;
           r = \operatorname{sqrt}(u \cdot \hat{2} + v \cdot \hat{2} + w \cdot \hat{2});
           +0.5*(v.^2 - w.^2).*\log(r - u)...
           +u \cdot *v \cdot * \log(r-v) \dots
           +v \cdot *w \cdot * atan(u \cdot *v \cdot /r \cdot /w) \dots
            +0.5*r.*u;
           f_{-}v = \dots
           +0.5*(u.^2 - w.^2).*\log(r - v)...
           +u \cdot *v \cdot * \log(r-u) \dots
           +u * w * atan(u * v . / r . / w) ...
            +0.5*r.*v;
           f_z = \dots
           -u \cdot *w \cdot * \log(r-u) \dots
            -v \cdot *w \cdot * \log(r-v) \dots
           +u * v * atan(u * v . / r . / w) ...
            -r \cdot * w;
```

```
 \begin{split} & fx = index\_sum .* f\_x; \\ & fy = index\_sum .* f\_y; \\ & fz = index\_sum .* f\_z; \\ & magconst = J*J2/(4*\pi*(4*\pi*1 \cdot 10^{-7})); \\ & Fx = magconst*sum(fx(:)); \\ & Fy = magconst*sum(fy(:)); \\ & Fz = magconst*sum(fz(:)); \\ & end \end{split}
```

14. And these are the stiffnesses.

```
Inputs:
                                  (a, b, c)
                                                                               the half dimensions of the fixed magnet
                                  (A, B, C)
                                                                               the half dimensions of the floating magnet
                                  (dx, dy, dz)
                                                                               distance between magnet centres
                                  (J, J2)
                                                                              magnetisations of the magnet(s) in the z-direction
  Outputs:
                                  (Kx, Ky, Kz)
                                                                              Stiffnesses of the 2nd magnet
\langle Parallel magnets stiffness calculation |14\rangle \equiv

                       index_q);
                        % Using this method is actually less efficient than using six for
                        % loops for h..q over [0 1]. To be addressed.
           u = dx + A*(-1) îndex_j - a*(-1) îndex_h;
           v = dy + B*(-1) . index_l - b*(-1) . index_k;
           w = dz + C*(-1) îndex_q - c*(-1) îndex_p;
           r = \operatorname{sqrt}(u \cdot \hat{2} + v \cdot \hat{2} + w \cdot \hat{2});
           k_{-}x = \dots
           -r\dots
            -(u \cdot \hat{2} \cdot v) \cdot / (u \cdot \hat{2} + w \cdot \hat{2}) \dots
            -v \cdot * \log(r - v);
           k_{-}y = \dots
            -r\dots
           -(v \cdot \hat{2} \cdot u) \cdot / (v \cdot \hat{2} + w \cdot \hat{2}) \dots
           -u \cdot * \log(r - u);
           k_{-}z = -k_{-}x - k_{-}y;
           kx = index\_sum .* k\_x;
           ky = index\_sum .* k\_y;
           kz = index\_sum .* k\_z;
           magconst = J*J2/(4*\pi*(4*\pi*1\cdot 10^{-7}));
           Kx = magconst*sum(kx(:));
           Ky = magconst*sum(ky(:));
           Kz = magconst*sum(kz(:));
```

$\quad \mathbf{end} \quad$

15. Orthogonal magnets forces given by Yonnet and Allag [2]. The magnetisation of the floating magnet J2 is in the positive y-direction.

 $\langle \text{ Orthogonal magnets force calculation } 15 \rangle \equiv$ **function** $[Fx Fy Fz] = forces_orthogonal(a, b, c, A, B, C, dx, dy, dz, J, J2)$ if nargin < 11J2 = J; elseif nargin < 10error('Wrong⊔number⊔of⊔input⊔arguments.') end $[index_h, index_j, index_k, index_l, index_p, index_q] = ndgrid([0\ 1]);$ $index_sum = (-1)$.^ $(index_h + index_j + index_k + index_l + index_p + index_k + index_l + index_l + index_p + index_l + in$ $index_q$; % (Using this method is actually LESS efficient than using six for % loops for h..q over [0 1], but it looks a bit nicer, huh?) u = dx + A*(-1) îndex_j - a*(-1) îndex_h; v = dy + B*(-1) . $index_l - b*(-1)$. $index_k$; w = dz + C*(-1) îndex_q - c*(-1) îndex_p; $r = \operatorname{sqrt}(u \cdot \hat{2} + v \cdot \hat{2} + w \cdot \hat{2});$ $f_x = \dots$ $-v \cdot *w \cdot * \ln(r-u) \dots$ $+v \cdot *u \cdot * \ln(r+w) \dots$ $+w \cdot *u \cdot * \ln(r+v) \dots$ $-0.5*u.^2.*arctan(v.*w./(u.*r))...$ $-0.5*v.^2.*arctan(u.*w./(v.*r))...$ $-0.5*w.^2.*arctan(u.*v./(w.*r));$ $fv = \dots$ $0.5*(u.^2 - v.^2).*ln(r + w)...$ $-u \cdot *w \cdot * ln(r-u) \dots$ -u * v * arctan(u * w . / (v * r)) ...-0.5*w .* r: $fz = \dots$ $0.5*(u.^2 - w.^2).*ln(r + v)...$ $-u \cdot *v \cdot * ln(r-u) \dots$ $-u * w * \arctan(u * v . / (w * r)) ...$ -0.5*v.*r; $fx = index_sum .* f_x;$ $fy = index_sum .* f_y;$ $fz = index_sum .* f_z;$ $magconst = J*J2/(4*\pi*(4*\pi*1\cdot 10^{-7}));$ Fx = magconst*sum(fx(:));Fy = magconst*sum(fy(:));

This code is used in section 12.

Fz = magconst*sum(fz(:));

16. Orthogonal magnets stiffnesses.

```
\langle Orthogonal magnets stiffness calculation |16\rangle \equiv
```

```
% not yet calculated
```

This code is used in section 12.

17. When the forces are rotated we use these rotation matrices to avoid having to think too hard.

 \langle Precompute rotation matrices $|17\rangle \equiv$

```
\begin{array}{l} Rx = @(\theta) \ [1 \ 0 \ 0; \ 0 \cos(\theta) - \sin(\theta); \ 0 \sin(\theta) \cos(\theta)]; \\ Ry = @(\theta) \ [\cos(\theta) \ 0 \sin(\theta); \ 0 \ 1 \ 0; \ -\sin(\theta) \ 0 \cos(\theta)]; \\ Rz = @(\theta) \ [\cos(\theta) - \sin(\theta) \ 0; \ \sin(\theta) \cos(\theta) \ 0; \ 0 \ 0 \ 1]; \\ rotate\_z\_to\_x = @(vec) \ Ry(\pi/2)*vec' \\ rotate\_x\_to\_y = @(vec) \ Rx(-\pi/2)*vec' \\ rotate\_y\_to\_z = @(vec) \ Rx(\pi/2)*vec' \end{array}
```

This code is used in section 5.

18. When users type help magnetforces this is what they see. This is designed to be displayed in a fixed-width font so the output here will be fairly ugly.

```
\langle Matlab help text ~18\,\rangle \equiv ~\% MAGNETFORCES Calculate forces between two cuboid magnets \% % Finish this off later. \%
```

19. Test files. The chunks that follow are designed to be saved into individual files and executed automatically to check for (a) correctness and (b) regression problems as the code evolves.

How do I know if the code produces the correct forces? Well, for many cases I can compare with published values in the literature. Beyond that, I'll be setting up some tests that I can logically infer should produce the same results (such as mirror-image displacements) and test that.

There are many Matlab unit test frameworks but I'll be using a fairly low-tech method. In time this test suite should be (somehow) useable for all implementations of magnetocode, not just Matlab.

```
\label{eq:magnet_fixed} $$\langle {\tt magnet\_fixed.dim} = [0.02\ 0.04\ 0.06];$$ $$magnet\_fixed.magn = 1.3;$$ $$magnet\_fixed.madir = [0\ 0]; $$\%$ $$vertical $$ $$magnet\_float.dim = [0.07\ 0.05\ 0.03];$$ $$magnet\_float.magn = 1.1;$$ $$magnet\_float.madir = [0\ 0]; $$\%$ $$vertical $$ $$magnet\_float.madir = [0\ 0]; $$\%$ $$vertical $$ $$magnet\_disp = [0.1\ 0.15\ 0.05]; $$
```

List of Refinements in magnetforces

```
\( magforce-test001a.m 19 \)
(magnetforces.m 2)
Calculate forces x-x 9 Used in section 6.
Calculate forces y-y 10 \ Used in section 6.
Calculate forces z-z 8 Used in section 6.
Calculate orthogonal forces 7 Used in section 5.
Calculate parallel forces \begin{array}{cc} 6 \end{array} \rangle Used in section 5.
Decompose orthogonal superpositions 4 \ Used in section 2.
Extract input variables 3 Used in section 2.
Functions for calculating forces and stiffnesses 12 Used in section 2.
\langle \text{Matlab help text } 18 \rangle Used in section 2.
Orthogonal magnets force calculation 15 Used in section 12.
Orthogonal magnets stiffness calculation 16 \rangle Used in section 12.
Parallel magnets force calculation 13 Used in section 12.
(Parallel magnets stiffness calculation 14) Used in section 12.
\langle \text{Precompute rotation matrices } 17 \rangle Used in section 5.
\langle Recombine results 11 \rangle Used in section 2.
```

 \langle Transform coordinate systems and calculate force components $\ 5 \ \rangle$ Used in section 2.
